The Bellman-Ford algorithm is an algorithm that computes shortest paths from a single source vertex to all of the other vertices in a weighted digraph. It is slower than Dijkstra's algorithm for the same problem, but more versatile, as it is capable of handling graphs in which some of the edge weights are negative numbers. The algorithm was first proposed by Alfonso Shimbel (), but is ...

In computer science, the subset sum problem is an important decision problem in complexity theory and cryptography. There are several equivalent formulations of the problem. One of them is: given a set (or multiset) of integers, is there a non-empty subset whose sum is zero? For example, given the set  $\{-, -, -, ,\}$ , the answer is yes because the subset  $\{-, -, \}$  sums to zero.

L'algorithme de Bellman-Ford, aussi appelé algorithme de Bellman-Ford-Moore [1], est un algorithme qui calcule des plus courts chemins depuis un sommet source donné dans un graphe orienté pondéré. Il porte le nom de ses inventeurs Richard Bellman et Lester Randolph Ford junior (publications en 1956 et 1958), et de Edward Forrest Moore qui le redécouvrit en 1959.
