Fundamentals of FLUID FLOW - PDH Storm

In physics and engineering, fluid dynamics is a subdiscipline of fluid mechanics that describes the flow of fluids—liquids and gases. It has several subdisciplines, including aerodynamics (the study of air and other gases in motion) and hydrodynamics (the study of liquids in motion). Fluid dynamics has a wide range of applications, including calculating forces and moments on aircraft ...

An early step in heat exchanger design is finding the heat transfer surface area needed for a specified heat transfer rate, estimated overall heat transfer coefficient, and calculated log mean temperature difference. The needed heat transfer surface area is calculated from the basic heat exchanger design equation: $Q = U A (\log \text{ mean temperature difference})$.
